

POWERDRIVE 1:1

CONTROL SYSTEM OVERVIEW

Cabrinha kites comes with an enhanced control system that allows you take full advantage of all the kite has to offer. We've made many tweaks and modifications based on our invaluable customer feedback to deliver the most cutting edge control system to date.

POWER ADJUSTERS

The CAS line extenders keep the adjustment of the centerline adjustment strap within easy reach at all times. We've added elastic to the Power Adjusters so that they maintain positive tension no matter where they are positioned.

FLAGGING RING

The flagging ring can be used to lay the kite flat on the water or beach when landing or self rescuing.

VERRIDE™ 2

The new Override™ stopper has been re-designed for more positive engagement and disengagement. The new internal catch mechanism is now mechanical instead of friction-based. It makes re-setting Override onto its sleeve a snap. Literally!

The external shape of Override 2™ accomplishes two things. First, the new ergonomics allow for a much better grip on the fitting when re-setting it onto its sleeve. Secondly the design integrates the CAS Power Adjusters for a much cleaner and more streamline operation of the kite's trim.

INCLUDES:

- Harness Loop
- Security Pin
- Line Managers
- Bar Floats

ALLOY CENTER SECTION

The Powerdrive 1:1 control system now implements our new forged alloy center section with an expanded entry and exit opening for the depower line. This feature increases the ease of bar movement over the depower line even at extreme angles.

QR

The quick release can be used to separate the rider from their kite. Note: If the Bypass leash is connected above the QR they must also activate the QR on the Bypass leash to fully separate from the kite.

LEASH INTERFACE BALL

The leash interface ball protects the base of the control bar from the Bypass leash clip when connected above the QR.

SOFTENED EVA GRIP

We have reduced the diameter of the control bar and have softened the EVA grip for a more hand friendly feel.

STAINLESS STEEL SWIVEL

An inline stainless steel swivel has been added to allow the rider to manually un-spin any twists in their front lines.

BYPASS LEASH™

The Bypass leash can be connected directly to the harness loop or above the QR handle. When connected above the QR handle the rider must also activate the QR on the Bypass leash to fully separate from the kite.
